

1. Prove that the log-sum-exp function

$$f(x) = \log \sum_{i=1}^m \exp(a_i^T x)$$

is convex.

2. Suppose that the scalar random variable  $x$  takes values  $\{a_1, a_2, \dots, a_n\}$  with probability  $\mathbf{prob}(x = a_i) = p_i$  for  $i = 1, \dots, n$ . Is the variance

$$\mathbf{var} x = \mathbb{E}x^2 - (\mathbb{E}x)^2$$

a convex or concave function in the probabilities  $p = (p_1, \dots, p_n)$ ? Prove your answer.

3. Prove that the intersection of convex sets  $\mathcal{S} = \mathcal{S}_1 \cap \mathcal{S}_2 \cap \dots \cap \mathcal{S}_n$  is a convex set.

4. Show that the *second-order cone*

$$\mathcal{S} = \{(x, t) \in \mathbf{R}^n \times \mathbf{R}_+ \mid \|x\|_2 \leq t\}$$

is convex.

5. Consider the convex optimization problem

$$\underset{x}{\text{minimize}} \quad f(x) \quad \text{subject to} \quad x \in \mathcal{C}, \tag{1}$$

where  $f : \mathbf{R}^n \rightarrow \mathbf{R}$  is a convex and differentiable function, and  $\mathcal{C} \subseteq \mathbf{R}^n$  is a convex set. A point  $x^* \in \mathcal{C}$  is optimal for (1) if and only if

$$-\nabla f(x^*) \in \mathcal{N}_{\mathcal{C}}(x^*), \tag{2}$$

where  $\mathcal{N}(x^*)$  is the normal cone of  $\mathcal{C}$  at point  $x^*$ .

- (a) Prove that (2) is equivalent to the condition

$$x^* = \mathbf{proj}_{\mathcal{C}}(x^* - \gamma \nabla f(x^*)) \tag{3}$$

for any constant  $\gamma > 0$ .

- (b) **Affine set.** Let  $\mathcal{C} = \{x \mid Ax = b\}$ .

- i. Derive the normal cone  $\mathcal{N}_{\mathcal{C}}(x)$ .
- ii. Use this expression for the normal cone to deduce that  $\nabla f(x^*)$  is in the range of  $A^T$ .

- (c) **Nonnegative constraint.** Let  $\mathcal{C} = \mathbf{R}_+^n$ .

- i. Derive the normal cone  $\mathcal{N}_{\mathcal{C}}(x)$ .
- ii. Use this expression for the normal cone to deduce that  $\nabla f(x^*) \geq 0$ .
